BIELS SINCE 1939
MICROFILM CORP.

Methylene Blue
Analysis

Customer Name: Micor Inc.

Address: 100 Clement Ave. Bensalem, PA 19020

Your sample film strips have been tested for archival quality (residual thiosulfate concentration). They were tested according to the methylene blue method described by the American National Standards Institute.

Concentrations of less than ($<$) 1.4 μ g (micrograms) indicate archival quality, and greater than ($>$) 1.4 μ g indicate non-archival quality. The test is only meaningful and accurate if performed no later than two weeks after processing. It is our understanding that we have received your film within the 2 week time-frame.

Actual test readings are provided below, as well as "pass/fail" check marks.

TEST IDENT.	ACTUAL CONCENTRATION	MEETS ANSI STANDARD ($<$) 1.4 μ g	DOES NOT MEET ANSI STANDARD ($>$) 1.4 μ g
RAFF-INC. Clement 2/29/91	.19	✓	

Archival quality, as measured by residual thiosulfate concentration, is defined in ANSI Standard IT9.1-AS: "A photographic film composed and treated so that under archival storage conditions it is suitable for the preservation of records having permanent value". This same Standard sets the archival limit at 1.4 μ g for residual thiosulfate.

A color calibration target, likely a Munsell Color Services Lab chart, featuring a grayscale step wedge and color patches. The grayscale steps are labeled 1 through 10, with corresponding numerical values for density and colorimetric data. The color patches are labeled with their respective Munsell colorimetric values (L*, a*, b*) and are used for ensuring color accuracy in digital imaging.

A color calibration chart featuring a grid of color patches. The patches are arranged in two rows. The top row contains patches labeled 1 through 10, and the bottom row contains patches labeled 11 through 20. Each patch is a small square with a specific color and a numerical value printed next to it. The values range from 1 to 20, corresponding to the patch numbers.

A color calibration target, likely a Munsell Color Services Lab chart, featuring a grayscale step wedge and color patches. The grayscale steps are labeled 1 through 25. The color patches are labeled with their respective Munsell colorimetric values (L*, a*, b*) and are arranged in a grid. The chart is used to ensure color accuracy and consistency in digital imaging and printing.

MICROFILM CORR

Methylene Blue
Analysis

Customer Name: Micor Inc

Address: 100 Sagamore Ave. Bensalem, PA 19012

Your sample film strips have been tested for archival quality (residual thiosulfate concentration). They were tested according to the methylene blue method described by the American National Standards Institute.

Concentrations of less than ($<$) 1.4 μ g (micrograms) indicate archival quality, and greater than ($>$) 1.4 μ g indicate non-archival quality. The test is only meaningful and accurate if performed no later than two weeks after processing. It is our understanding that we have received your film within the 2 week time-frame.

Actual test readings are provided below, as well as "pass/fail" check marks

TEST IDENT.	ACTUAL CONCENTRATION	MEETS ANSI STANDARD ($\leq$) 1.4 μ g	DOES NOT MEET ANSI STANDARD ($>$) 1.4 μ g
APR 1985 Bensalem 5/2/85	1.9		

Archival quality, as measured by residual thiosulfate concentration, is defined in ANSI Standard IT9.1-AS: "A photographic film composed and treated so that under archival storage conditions it is suitable for the preservation of records having permanent value". This same Standard sets the archival limit at 1.4 μ g for residual thiosulfate.
